THE CUMULATIVE INDEX

Nursing Research **Volumes I - IV**

This, the first cumulative index to *Nursing Research,* brings together in one alphabetic file references to all articles published in volumes one to four, or from June 1952 through February 1956, inclusive.

The references are arranged by author and subject. Where the study is the product of several authors, we have listed it only under the first author named, with cross references under the succeeding names.

About authors' names, no matter how unusual they may be in sound or spelling, there can be no argument. About subject headings there can be plenty of argument, particularly where the over-all subject, like nursing research, is in the process of vigorous development. Whenever possible, we have consulted established authorities to help determine the most appropriate and accurate heading. *The Quarterly Cumulative Index Medicus,* published by the American Medical Association, and the *Subject Heading Authority List,* published by the Armed Forces Medical Library, give us the correct medical terms. The National League for Nursing's *Library Handbook for Schools of Nursing,* second edition, supplies us with general terms in the field of nursing. In H.W. Wilson Company's *Education Index,* we find usable headings for educational and research material, such as "Communication Arts," and "Methodology." But, in the last analysis, the listing of a particular reference under a given subject heading is always determined by opinion, and opinions are bound to vary—even one individual's.

We have used a comparatively large number of subject headings, hoping by this means both to avoid entering too many items under any one head, and to provide enough "key words" for the searcher. Most items will be found under more than one heading.

The "Studies in Nursing" list that has appeared in each issue of *Nursing Research* since October 1954 has presented a difficult problem in indexing. Obviously, to index the studies completely—that is, to enter the frequently very long title of each study under the name of the author, and again and again under the two or three possible subject headings—would require more space in the index than the studies occupy in the magazine. Therefore, we entered none of them as individual items. Instead, under each subject heading which indicates the field of one or more studies, we have entered the phrase, "studies in nursing (summaries)," followed by the page or pages on which those studies are listed.

Finally, this index might serve still another purpose in addition to helping the reader locate the article in which he is interested. That is, it may provide a bird's-eye-view of the relative amount of research that has been carried on during the past four years in the various fields of nursing. Some subject headings, for instance, are followed by a long list of references; others, by only one or two. The index, used in this way, might serve prospective researchers very well.
